DigMart

Getting started with DigMart.

Find the tracks you're after, preview them before you download, and know every file is real and club-ready before it touches your library.

INSTALL · SET UP · DIG · DOWNLOAD · BATCH

STEP 1

Install it

On a Mac

Needs a Mac with Apple Silicon (M1, M2, M3 or M4). To check: Apple menu → About This Mac → "Chip".

1. Double-click **DigMart-...-macOS-AppleSilicon.dmg**. A window opens: drag **DigMart** onto **Applications**.
2. Open **DigMart** from Applications (or Launchpad). The first time, macOS says it can't check it and won't open it. That's normal for apps from outside the App Store. Click **Done**.
3. Open **System Settings → Privacy & Security**, scroll down to the message about DigMart, and click **Open Anyway**. Enter your Mac password if asked, then **Open**.
4. From now on it opens normally.

On Windows

1. Double-click **DigMart-...-Setup.exe**.
2. If a blue box says **"Windows protected your PC"**, click **More info**, then **Run anyway**.
3. Click through the installer. DigMart opens at the end and gets a Start menu shortcut.

> **It keeps itself up to date.** When a new version is ready, DigMart downloads it in the background and asks you to restart. Nothing to reinstall.

STEP 2

Set it up (2 minutes)

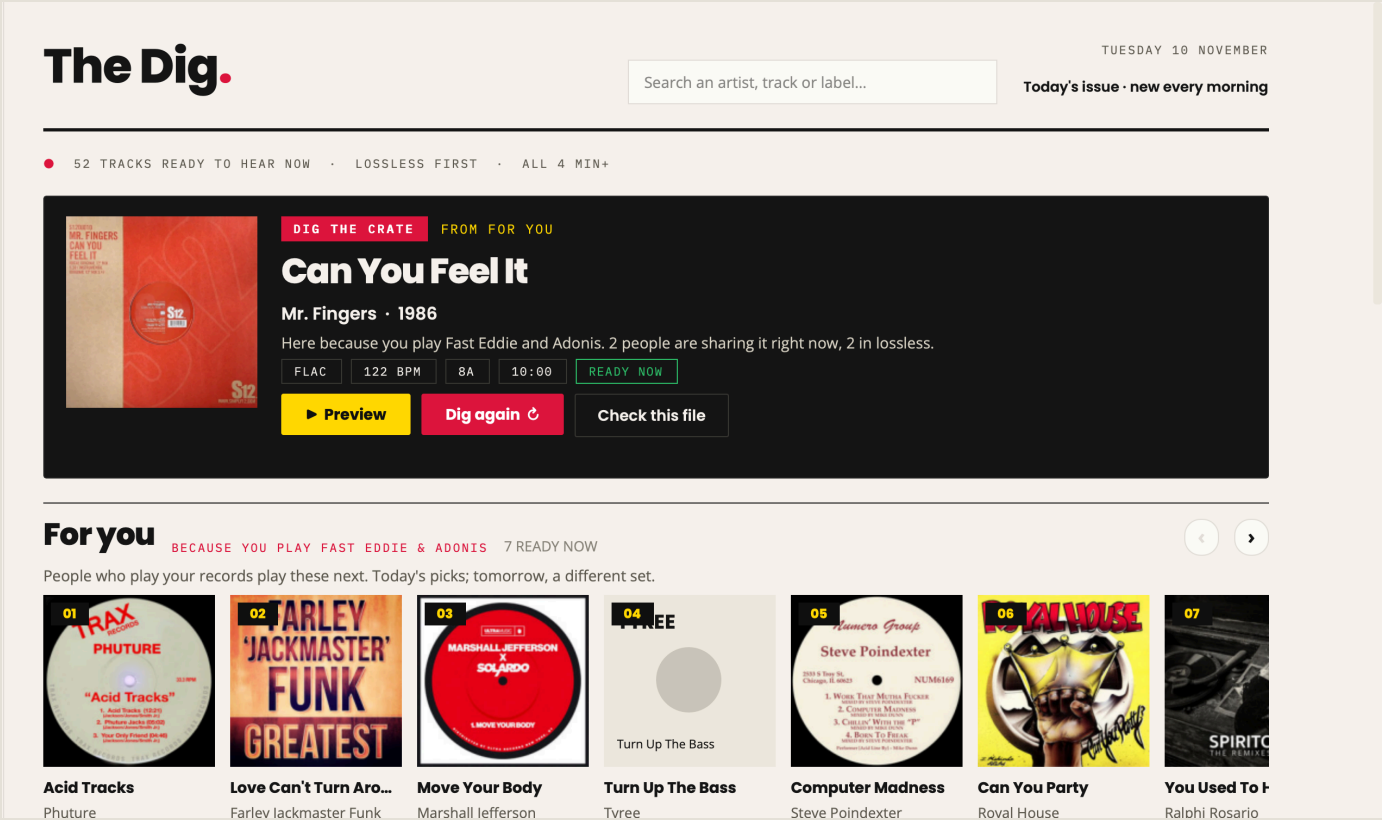

1. **Make your account:** your name, email and a password.
2. **Pick your library folder:** where finished tracks go. Nothing lands there until you approve it.
3. **Choose what to share.** DigMart runs on a file-sharing network. People who share get served first, so sharing your library folder means faster downloads.
4. **Getting things ready:** DigMart connects for you. You don't need a Soulseek account or any other setup.

A quick **tour** then shows you around (about a minute). You can replay it any time from your name in the bottom-left corner.

STEP 3

Dig: the Discover page

Discover is a new issue every morning, built around what you play. Every track on it is being shared right now, is 4 minutes or longer, and lossless copies come first.

Dig the crate (the big panel at the top)

- **▶ Preview** plays 20 seconds of the track. Nothing is downloaded.
- **Dig again** jumps to the next random track, and it starts playing straight away.
- **Check this file** downloads it and checks it (see Step 4).

Below it

- **For you**: artists people play alongside the ones in your library. It gets better as your library grows.
- **The eras**: three eras a day (Chicago jack, Detroit deep, NY garage…), with the artists who made them.
- **Styles of the day**: five styles, a different five each day.

Click a cover to preview it. **Click a title** to open the track with its details and buttons. Use the **‹ ›** arrows, or swipe, to see more of a row.

STEP 4

Check it, then keep it

Nothing goes straight into your library. Every file is checked first, so you never play a fake 320 or a broken file out.

1. Press **Check this file** on anything you like (from Discover or Search).
2. Go to **Queue** in the sidebar. You'll see it downloading, then being checked.
3. Click the track to see its details: BPM, key, length, format, the spectrogram, and whether it's **CLUB-READY** (it loads on your decks, holds up in mono on a big system, isn't clipping, has proper low end).
4. Its verdict: `GOOD` nothing to worry about, `LOOK` worth a listen first, `NO CLUB` the file is real but won't hold up on a club system (out of phase, or your decks can't load it), `BROKEN` don't use it.
5. Press **Download to Library** to keep it, or **Delete** to get rid of it. LOOK and NO CLUB tracks say **Download anyway**. A checked track waits in the Queue until you decide.

STEP 5

Search for something specific

- Go to **Search** and type an artist, track or label. Results come from everyone's libraries, fastest and best quality first.
- Use the filters (**Lossless**, **4 min+**, file type and more) to narrow it down.
- Click a result to preview it, or **Check this file** to get it.
- **Nobody has it?** Press **Watch this search**. DigMart keeps looking every half hour for 30 days, and when a good copy shows up it lands in your Queue, counted under **Wishlist**.

STEP 6

Get a whole playlist: Batch

Got a playlist you want in lossless? Batch finds the best copy of every track on it, so you don't search them one by one.

1. Go to **Batch** in the sidebar.
2. Paste a **YouTube, SoundCloud, Spotify or Apple Music** playlist link and press **Enter** (or drag the link onto the window). You can also type a list of tracks, one **Artist - Title** per line (Shift+Enter for a new line).
3. Each playlist becomes its own batch. DigMart searches every track and marks it **Found**, **Not found** or **Already have** (it's in your library already).
4. Press **Download and check** to get everything it found, or press **Found** on a single row, then again to confirm, to get just that one. Click a row to pick a different copy.
5. Every track still goes through the Queue and the same checks. What you keep is saved in a folder named after the playlist.

> **Upgrading old files?** Press **Folder...** and pick a folder of low-quality tracks (old MP3s, rips). DigMart looks for a better copy of each one.

Pause stops a batch; tracks that didn't get found can be watched from Search with **Watch this search**.

Everything else

Library

Everything you've kept, with BPM, key and all its facts. Click a track to play it or see its details. **Find upgrades** spots weak copies (under 320, not club-ready) and finds a better one being shared right now.

Crates

In the sidebar: make crates for your sets and add tracks from the Library. Open a crate (or the whole Library) and press **Export to Rekordbox**: BPM, key and hot cues, and it can copy the files to a USB stick.

Add your own files

Got tracks from somewhere else? Drag them onto the window (or **Add files** in the Queue) to check them the same way.

Your account (bottom-left)

Click your name for **Settings**, **Appearance** (light or dark), **Help & FAQ** (this guide), the **tour** again, and sign out.

Something wrong?

Click your name → **Settings** → **Advanced** → **Send a report…** and add a line about what happened. It makes a zip of the app's logs (no passwords) for you to email to Reyes.

Tips

- The dot in the sidebar turns **green** when you're connected. Discover fills in a few seconds after.
- Not connecting? Click your name → **Settings** → **Advanced**. The **Connection** part says what's wrong, with **Test again**. If your computer asks to allow incoming connections, choose **Allow**.
- The first open each day takes a little longer while the new issue is put together.
- Share your library folder: you'll get served faster.

> **The whole loop:** Preview → Check this file → Download to Library. A whole playlist at once: Batch. Have fun digging.
